

- Means the Classes are connected by constructors
- Means the class at the end of the arrow is a child class,
and the arrow's root is the parent
- The class at the root of the arrow relies on the class at the arrow head because of some template purposes.
- The Life class takes an AbstractCell class, but it can also take a Handle class that uses AbstractCell as it's template.
- ConwayCell and FredkinCell are both children of AbstractCell, while Cell it's self is a child of Handle.
- Because Handle takes AbstractCell as it's template it makes calls to either Conway or Fredkin for Construction and deletion purposes.
